

simulate micrograph — same shipped-scale specimen, 500×4096^2 at $1 \text{ \AA}$
Float32 potential / complex64 propagation; clean and fixed-seed noisy images bitwise identical

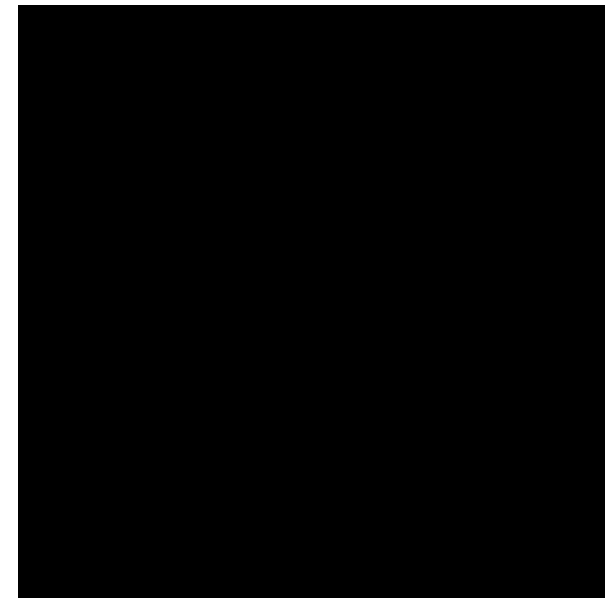

Before: clean micrograph, central 1024^2 crop

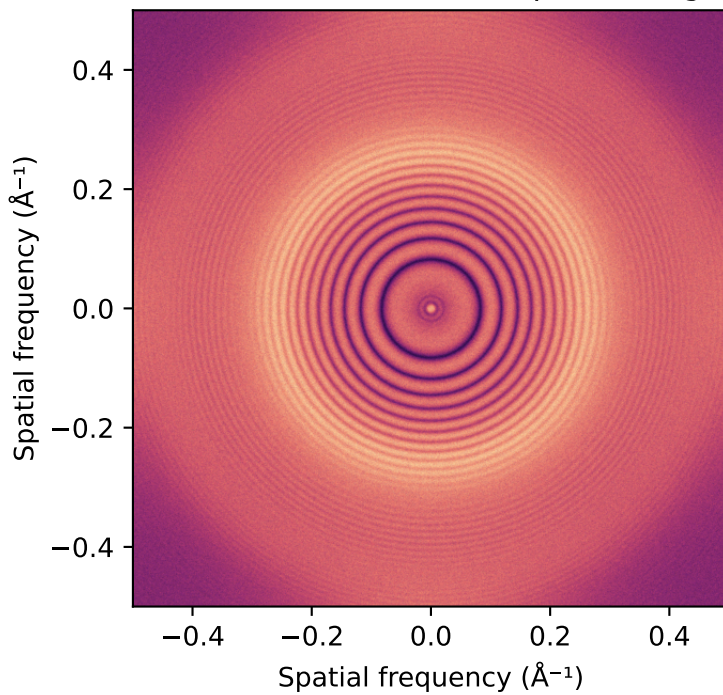

After: clean micrograph, central 1024^2 crop

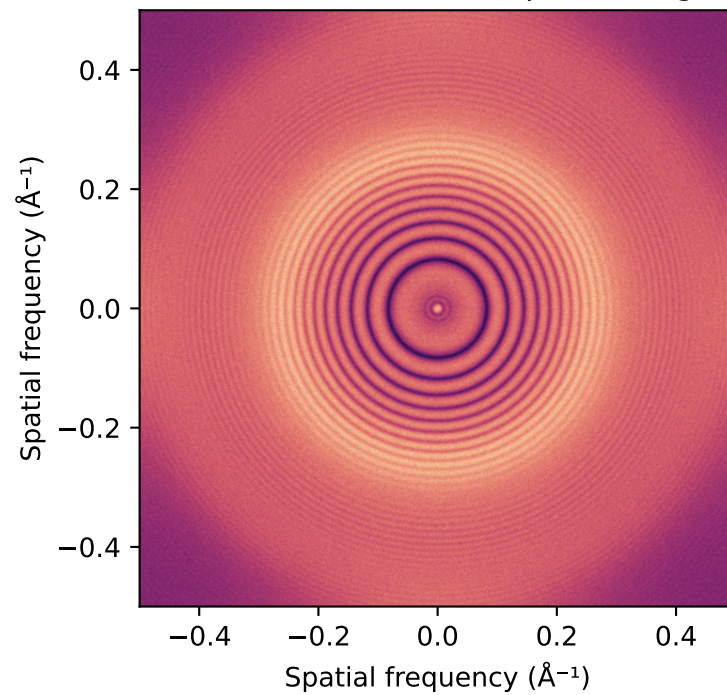

Absolute difference: exactly zero

Before: full 4096^2 Fourier power ($\log_{10}$)

After: full 4096^2 Fourier power ($\log_{10}$)

Radial spectra overlap exactly
